CiteSeerX - Document Details (Isaac Councill, Lee Giles, Pradeep Teregowda): Abstract- The control of dense-phase pneumatic conveying systems is notoriously difficult. Specifically, achieving sufficiently low air velocity to ensure efficient power utilisation, low product degradation and plant wear, whilst ensuring that blockage of the pipeline does not occur, is the greatest challenge.

Process equipment manufacturer Gericke USA, Somerset, NJ, has unveiled a mobile STP 61 pneumatic conveying control system. Developed to prevent product loss, contamination and fugitive dust emissions during the unloading of powders, pellets and other bulk materials from tankers, trailers, railcars, and silos, the mobile STP 61 enables process engineers to deploy the company's proprietary technology used to automate conveying inside the plant at the point of receiving outside the plant.

Air Pollution Control for Pneumatic Conveying

All pneumatic conveying systems require a control system. This may be designed in many different configurations in order to suit the application and environment. To satisfy these demands, controls may be fully pneumatic, fully electrical or a combination of both.

Vacuum Conveying Systems

Pneumatic conveying is key to a bulk material handling system. Our range of Clyde Process, Pneumatic Conveying systems – using Dense Phase – are proudly adopted globally and provide dependable, high efficiency performance, whilst being bespoke and engineered for the processing of bulk materials, in a variety of industries.

Dense Phase Pneumatic Conveying Systems

Valves and sensors control the air pressures and velocities. When the predetermined low pressure setting is reached at the end of the conveying cycle, the air supply is turned off and the residual air volume purges the pressure vessel and the conveying line.

Instrumentation & Control. Here at pneumatic conveying we pride ourselves in supplying a complete process. We can offer completely bespoke control units that fully optimise batch production to continuous conveying. We offer SCADA, HMI, Inverter and PLC options to control your system. If manual is your preferred choice the entire system can be operated using via switches on a control panel so that the operator can dictate the speed of production.

The aim of the investigative work was to achieve control of the air velocity and solids loading factor for the conveying system to maintain dilute phase flow at a prescribed dune level. The solids material conveyed was sensed using a PC based electrical tomographic imaging system and this was used to control the air velocity in the conveying system.

In this paper, pneumatic conveying pipe lines are examined as devices for attrition control. Three case studies are shown. The first case study is the classical one, i.e., to prevent the attrition in cases that the conveying is used only to transfer the bulk from one process to another without changing significantly its character.

Figure 1: Dilute-phase conveying system Pneumatic conveying is achieved by creating a pressure differential along a pipeline and using the air that moves toward the area of lower pressure to move bulk material. This process can be performed with a vacuum inducer or by injecting compressed air into one end of a pipeline or along the pipeline.
