Introduction To Spread Spectrum Communication Solution Manual

A spread spectrum communications system is one that is built upon the principle of transmitting information signals over a much wider bandwidth than is strictly necessary for transferring the information. By transmitting over a larger bandwidth, robustness against external narrowband interference is increased, since the wider the bandwidth of any transmitted signal the lower will be the relative influence of interference over a small part of the bandwidth.

Solution Manual For Digital Communications By John Proakis

(PDF) Solution Manual For Digital Communications By John ...

There are two predominant techniques to spread the spectrum: 1) Frequency hopping (FH), which makes the narrow band signal jump in random narrow bands within a larger bandwidth. 2) Direct sequence (DS) which introduces rapid phase transition to the data to make it larger in bandwidth.

Understanding Spread Spectrum for Communications - NI

A spread-spectrum signal can be created by multiplying the existing baseband signal by a spreading sequence, also known as a PN code. The original signal is recovered by multiplying the spread-spectrum signal by the same PN code. A spread-spectrum signal has lower peak power, equal total power, and wider bandwidth.
